Corpse flower

Majority of the plants are autotrophs as they are able to synthesize their own food and do self-nutrition. However, some plant species have adopted the heterotrophic mode of nutrition.

Rafflesia Aarnoldii, also known as Kerubut, is a species of flowering plant which exhibits a parasitic mode of nutrition. The South Asian plant bears the largest flower on earth. It has a very strong and stinky odour of decaying flesh, earning it the nickname "corpse flower".

Kerubut means Devil's Betelnut Box. *Rafflesia Arnoldii* is one of the three national flowers in Indonesia. White Jasmine and Moon orchid are the two other flowers.

It is endemic to the rainforests of Sumatra and possibly Borneo.

Rafflesia has no roots and leaves. It is usually unnoticeable, hidden inside the stem or root of its host. The flower becomes visible when its buds emerge from its host. The flower is reddish and white marks on its petals which are 5 in number. *Rafflesia* flower generally grows to 3 feet but there have been pieces of evidence of the flower measuring 3.4 feet. *Rafflesia* flower blooms for 7 days. It releases a stinky odour of decomposing flesh which is very appealing to its main pollinator "Carrion Fly". Flies are attracted by the smell of decomposing flesh and help in performing pollination. *Rafflesia* is unisexual that means it carries both male and female body parts.

Although there are plants which have bigger flowering parts but they are more of a cluster of flowers. *Rafflesia* is a single flower of 5 petals and is definitely the biggest one out there.

Question : Which of the following is not a national flower of Indonesia?

A. Kerubut
